

This project is a simple Library Management System written in C++.

The program helps a user store book numbers and search for a book by entering its number.

The system allows the user to manage books by storing books and searching for them

The system can store up to three books and search for a book using its number

The programming Language used C++ and the Compiler was falcon C++

This is how the Program Works step by step

- a) Run the program by pressing f9
- b) The user enters a book number
- c) The program searches for the book
- d) The result is shown on the screen

When you enter book number 1, 2, 3 it will output book found, if you enter any other number it will output book not found
